Titanium housing for use in strongly saline media: TSS TITANIUM7 sc

Digital process probe for turbidity and suspended solids measurements. Suitable for seawater and strongly saline media. Installation in open basins and channels.

The TSS sc probes can measure both on-line

suspended solids and turbidity in one instrument. This flexibility enables the measurement of both parameters under the same application.

They have a double optical system with two pulsating infrared LEDs and four receivers. As the transmitted light is scattered, the receivers pick up the incident light at 90° and 120° angles effectively doubling the accuracy of the instrument. This eight channel measurement system, with an integrated bubble and temperature compensating software, enables the instrument to have a wide measuring range that effectively covers most applications, from the darkest pre-treated water to the freshest of spring waters, with one instrument.

TSS sc titanium probes are used for all applications in which aggressive media can attack stainless steel. TSS TITANIUM7 sc is especially suitable for seawater. The probe is used in seawater desalination plants or

in measuring stations that come into contact with seawater.

TSS sc probes have been specially developed for industrial applications

Measures both turbidity and suspended solids

8 measurement signals cover the total range and deliver measured values in conformity with the relevant standards

Excellent stability thanks to comprehensive compensation for interference factors

TSS sc has a unique compensation system to overcome the effects of air bubbles
